Continuation of 11. does NOT place the application in condition for allowance because: Regarding Applicant's remarks that Swearingen fails to disclose the limitations of claim 1 including no contact between the peripheral ring and exhaust housing at any location, the Examiner respectfully disagrees. As stated in the Final Office Action on page 2, the peripheral ring is the integral part of the outer ring (46) that is located near 26 in Figure 1. As required by the claim, this peripheral ring is integrally formed with the outer ring (46) and fitted on the nozzle ring (36, fitted onto it in the axial direction) and coupled to the center housing (outside 30, via 36). This peripheral ring (inner part of 46) is radially and axially spaced from the exhaust housing (12, see left of 46 and right of 44 in Figure 1) so that any contact between the exhaust housing and the peripheral ring is avoided at all locations. Applicant points to mechanical contact by the bolt 48 at the radially outer edge of the outer ring 46 as evidence that the peripheral ring makes contact with the exhaust housing. However, this is not the peripheral ring that contacts the housing, but the outer ring. Examiner suggests amending the broad structural language in claim 1 to further describe the location or structural relationship of the peripheral ring or exhaust housing in order to overcome the applied Swearingen prior art reference.
